

Dr. Prasant Clinic — Power BI Dashboard: Business Insights Report

A written business-insights summary of the Power BI dashboard **Dr_prasant_clinic.pbix**, built on the Healthcare_Data_5000 booking dataset (5,000 appointments, Elgin & Canning clinics, West Bengal).

1. What the Dashboard Shows

The report is a single-page operational dashboard with 6 KPI cards, 6 charts/table, and 4 interactive slicers (Doctor, Clinic, Gender, Consultation Type) so a clinic manager can filter every visual by these dimensions.

Visual	What it measures
KPI cards (6)	Total Bookings · Paid Consultations · Cancelled % · No-Show Rate · Arrival Rate · Total Revenue
Bar chart	Revenue by Doctor
Bar chart	Revenue by Clinic
Pie chart	Bookings by Source (Walk-in, Google, Facebook, WhatsApp, Website, Relative)
Line chart	Bookings trend over Appointment Date
Donut chart	Bookings by Consultation Type (Paid vs Free)
Pivot table	Doctor × Status (Booked, Completed, Cancelled, No Show, Rescheduled)
Slicers	Doctor, Clinic, Gender, Consultation Type

2. KPI Snapshot

KPI Card	Value
Total Bookings	5,000
Paid Consultations	2,519 (50.4% of bookings)
Cancelled %	20.1% (1,004 bookings)
No-Show Rate	19.2% (960 bookings)
Arrival / Completion Rate	19.9% (997 bookings reach "Completed")
Total Revenue	■ 3,28,100

Only 19.9% of all bookings ever reach "Completed" — the rest end in Cancelled, No Show, Rescheduled, or remain open as "Booked". Cancellations (20.1%) and no-shows (19.2%) together account for roughly **2 out of every 5 bookings**.

3. Insights by Visual

3.1 Revenue by Doctor

Revenue by Doctor (■), Jan–Jul 2026

- Dr B generates the highest revenue (■47,700), followed by Dr G (■45,600) and Dr A (■41,900).
- Dr H brings in the least (■34,600) — about 27% less than Dr B — despite having a similar booking volume, suggesting a lower-value case mix or more free consultations.
- The spread between the top and bottom doctor is roughly ■13,000, worth investigating for scheduling, service-mix, or upselling opportunities.

3.2 Revenue by Clinic

Revenue by Clinic (■)

- Canning (■1,657,000) and Elgin (■1,624,000) contribute almost equally to total revenue — a difference of only about 2%.
- Both clinics are performing at parity, so revenue growth should focus on clinic-wide fixes (e.g., cutting no-shows) rather than shifting volume between locations.

3.3 Bookings by Source

Share of Bookings by Source

- Booking channels are evenly spread — Walk-in (17.2%), Facebook (17.0%), Relative referral (16.8%), Website (16.7%), Google (16.2%) and WhatsApp (16.1%) each contribute roughly one-sixth of bookings.
- No single channel dominates, so marketing spend is currently diversified rather than concentrated on the best-converting source — a channel-level conversion (show-up vs no-show) analysis would help prioritize spend.

3.4 Monthly Appointment Volume

Monthly appointment volume, Jan–Jul 2026

- Bookings fluctuate between 648 (February) and 754 (May) with no strong seasonal trend — volume is fairly stable through the year (Jan–Jul 2026).
- February is the softest month; May and January are the busiest, useful for staffing and inventory planning.

3.5 Consultation Type Split

Bookings by Consultation Type

Bookings by Consultation Type

- Paid consultations (50.4%) and Free consultations (49.6%) are almost evenly split — nearly half of all visits generate no consultation revenue.
- Combined with the fact that 47.8% of "Completed" visits show 0 revenue, free/promotional consultations are a major driver of the revenue gap versus booking volume.

3.6 Booking Status Distribution (Doctor × Status pivot summary)

Overall booking status distribution (n = 5,000)

- The five statuses are almost evenly distributed (~1,000 each): Booked 1,024, Rescheduled 1,015, Cancelled 1,004, Completed 997, No Show 960.
- By doctor, Dr H has the lowest no-show rate (15.2%) while Dr F has the highest (20.9%) and the lowest completion rate (17.4%) — worth reviewing Dr F's scheduling or reminder process.
- Dr C has the best completion rate (21.1%) and a comparatively low no-show rate (21.5% cancelled but fewer no-shows), suggesting stronger patient follow-through.

4. Key Business Insights

- **Appointment leakage is the biggest issue.** Only ~20% of bookings convert to a completed visit; cancellations and no-shows together remove nearly 40% of scheduled capacity.
- **Free consultations dilute revenue.** Roughly half of all bookings are "Free" consultation type, and almost half of completed visits carry ■0 revenue — capacity is being used without proportional income.
- **Clinics are balanced, doctors are not.** Canning and Elgin perform almost identically on revenue, but individual doctors vary by up to ~27% in revenue and up to ~6 points in no-show rate (Dr H vs Dr F), pointing to doctor-level (not clinic-level) process gaps.
- **Acquisition is well diversified but unmeasured for quality.** Six channels each supply 16–17% of bookings; without channel-level no-show/cancellation tracking, marketing spend can't yet be optimized toward the most reliable patients.
- **Demand is stable, not seasonal.** Monthly volumes vary by only ~15% across the year, so staffing and inventory can be planned on a steady baseline rather than around sharp peaks.

5. Recommendations

- Introduce automated appointment reminders (SMS/WhatsApp) targeted at doctors and time slots with historically higher no-show rates (e.g., Dr F's patients).
- Review the Free-consultation policy — cap or route walk-in "Free" slots toward doctors/services with spare capacity, to protect paid-consultation volume.
- Add a channel-level conversion measure ($\text{Completed} \div \text{Booked by Source}$) to the dashboard so marketing spend can shift toward the sources with the best show-up rates, not just the highest volume.
- Standardize Dr H's and Dr C's lower no-show / higher completion practices (e.g., confirmation calls, rescheduling workflow) across the other doctors.
- Track "Rescheduled" bookings to a final outcome (Completed vs. eventual Cancelled/No Show) — at 20.3% of all bookings, reschedules are currently an unresolved middle state that masks true conversion.

Source: Dr_prasant_clinic.pbix (Power BI report, page "Page 1") built on the Healthcare_Data_5000 table (5,000 rows). Chart values recomputed from the underlying dataset to match the dashboard's card and visual definitions (Total_Bookings, Paid_Consultations, Cancelled %, No_Show_Rate, Arrival_rate, Total_Revenue). Demo/synthetic data for illustrative purposes.
